[EUR]	16K0F3E (25.0 kHz)	14K0F3E (20.0 kHz)	8K0F3E (12.5 kHz)										
• Number of conventional channels	: 2 ch (IC-F14S/F15S), 16 ch (IC-F14/F15)												
• Antenna impedance	: 50 Ω												
• Operating temperature range	: -30°C to +60°C (-22 °F to +140°F) [USA], [GEN] -25°C to +55°C [EUR]												
• Power supply requirement	: 7.2 V DC nominal (negative ground)												
• Current drain (at 7.2 V DC ; approx.)	:												
	<table border="1"><thead><tr><th colspan="2">RECEIVING</th><th colspan="2">TRANSMITTING</th></tr></thead><tbody><tr><td>Stand-by</td><td>Max. audio</td><td>High (at 5 W)</td><td>Low (at 1 W)</td></tr><tr><td>70 mA</td><td>300 mA</td><td>1.5 A</td><td>0.7 A</td></tr></tbody></table>	RECEIVING		TRANSMITTING		Stand-by	Max. audio	High (at 5 W)	Low (at 1 W)	70 mA	300 mA	1.5 A	0.7 A
RECEIVING		TRANSMITTING											
Stand-by	Max. audio	High (at 5 W)	Low (at 1 W)										
70 mA	300 mA	1.5 A	0.7 A										
• Dimensions (projections not included)	: 53(W)×120(H)×38(D) mm												
	: 29/32(W)×423/32(H)×11/2(D) in												
• Weight (Including BP-231)	: Approximately 260 g (93/16 oz)												

2. TRANSMITTER

• Output power (at 7.2 V DC)	: 5 W
• Modulation	: Variable reactance frequency modulation
• Maximum permissible deviation	: ±5.0 kHz (Wide), ±4.0 kHz (Middle), ±2.5 kHz (Narrow)
• Frequency error	: ±2.5 ppm
• Spurious emissions	: 80 dB (typical) [USA], [GEN] 0.25 μW (≤ 1 GHz), 1.0 μW (> 1 GHz) [EUR]
• Adjacent channel power	: 70 dB min. (Wide, Middle ; 80dB typ.) 60 dB min. (Narrow ; 70dB typ.)
• Audio harmonic distortion	: 3% typical (AF 1 kHz, 40% deviation)
• Hum and Noise ([USA], [GEN]) (without CCITT filter)	: 40 dB min. (46 dB typical) for Wide 34 dB min. (40 dB typical) for Narrow
• Residual modulation ([EUR] only) (with CCITT filter)	: 45 dB min. (55 dB typical) for Wide 43 dB min. (53 dB typical) for Middle 40 dB min. (50 dB typical) for Narrow
• Limiting charact of modulator	: 60–100% of maximum deviation
• Microphone impedance	: 2.2 kΩ

3. RECEIVER

• Receive system	: Double conversion superheterodyne system
• Intermediate frequencies	: 1st IF: 46.35 MHz, 2nd IF: 450 kHz
• Sensitivity	: 0.25 μV (-119 dBm) typical at 12 dB SINAD [USA], [GEN] -4 dBμ (-111 dBm) emf typical at 20 dB SINAD [EUR]
• Adjacent channel selectivity	: 70 dB min. (75 dB typical) for Wide and Middle 60 dB min. (65 dB typical) for Narrow
• Spurious response	: 70 dB min.
• Intermodulation rejection ratio	: 70 dB min. (74 dB typical) [USA], [GEN] 65 dB min. (67 dB typical) [EUR]
• Hum and Noise ([USA], [GEN] only) (without CCITT filter)	: 40 dB min. (50 dB typical) for Wide 34 dB min. (45 dB typical) for Narrow
• Hum and Noise ([EUR] only) (with CCITT filter)	: 45 dB min. (55 dB typical) for Wide 43 dB min. (53 dB typical) for Middle 40 dB min. (50 dB typical) for Narrow
• Audio output power	: 0.5 W typical at 5% distortion with an 8 Ω load
• Squelch sensitivity (at threshold)	: 0.25 μV typical [USA], [GEN] -4 dBμV (EMF) typical [EUR]
• Output impedance (Audio)	: 8 Ω

Specifications are measured in accordance with EIA-152-C/204D, TIA-603 or EN 300 086.

All stated specifications are subject to change without notice or obligation.

SECTION 2

CIRCUIT DESCRIPTION

2-1 RECEIVER CIRCUITS

2-1-1 ANTENNA SWITCHING CIRCUIT

The antenna switching circuit functions as a low-pass filter while receiving and a resonator circuit while transmitting. This circuit does not allow transmit signals to enter the receiver circuits.

Received signals enter the antenna connector (CHASSIS; J1) and pass through the low-pass filter (L1–L3, C2–C5, C175, C176). The filtered signals are passed through the $1/4\lambda$ type antenna switching circuit (D5, D6, L6, L7) and then applied to the RF circuit.

2-1-2 RF CIRCUIT

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit pass through the bandpass filter (D4, D8, L8, L9). The filtered signals are amplified at the RF amplifier (Q2) and then passed through the another bandpass filter (D9, D10, L11) to suppress unwanted signals. The filtered signals are applied to the 1st mixer circuit.

D4, D8–D10 employ varactor diodes, that are controlled by the CPU via the D/A converter (IC8), to track the bandpass filter. These varactor diodes tune the center frequency of an RF passband for wide bandwidth receiving and good image response rejection.

2-1-3 1ST MIXER AND 1ST IF CIRCUITS

The 1st mixer circuit converts the received signal into fixed frequency of the 1st IF signal with the PLL output frequency. By changing the PLL frequency, only the desired frequency passes through a crystal filter at the next stage of the 1st mixer.

The RF signals from the bandpass filter are mixed with the 1st LO signals, where come from the RX VCO circuit via the attenuator (R26–R28), at the 1st mixer circuit (Q3) to produce a 46.35 MHz 1st IF signal. The 1st IF signal is passed through a monolithic filter (F11) in order to obtain selection capability and to pass only the desired signal. The filtered signal is applied to the 2nd IF circuit after being amplified at the 1st IF amplifier (Q4).

2-1-4 2ND IF AND DEMODULATOR CIRCUITS

The 2nd mixer circuit converts the 1st IF signal into a 2nd IF signal. The double-conversion superheterodyne system (which convert receive signals twice) improves the image rejection ratio and obtains stable receiver gain.

The 1st IF signal from the IF amplifier (Q4) is applied to the 2nd mixer section of the FM IF IC (IC1, pin 16), and is mixed with the 2nd LO signal to be converted into a 450 kHz 2nd IF signal.

The FM IF IC (IC1) contains the 2nd mixer, 2nd local oscil-

lator, limiter amplifier, quadrature detector, active filter and noise amplifier circuits. A 2nd LO signal (45.9 MHz) is produced at the PLL circuit by tripling its reference frequency (15.3 MHz).

The 2nd IF signal from the 2nd mixer (IC1, pin 3) passes through the ceramic filter (F12) to remove unwanted heterodyned frequencies. It is then amplified at the limiter amplifier section (IC1, pin 5) and applied to the quadrature detector section (IC1, pins 10, 11) to demodulate the 2nd IF signal into AF signals.

The demodulated AF signals are output from pin 9 (IC1) as "DET" signal, and are then applied to the AF circuit.

2-1-5 AF AMPLIFIER CIRCUIT

The AF amplifier circuit amplifies the demodulated AF signals to drive a speaker.

The AF signals from the FM IF IC (IC1, pin 9) pass through the high-pass filter (IC6, pins 3 and 1) to suppress unwanted harmonic components. The signals pass through the RX mute switch (Q34) which is controlled by "RMUT" signal from the CPU (IC13, pin 56), and are then applied to another high-pass filter (IC6, pins 13 and 14). The filtered signals pass through the low-pass filter (IC6, pins 6 and 7) via the analog switch (IC10, pins 1 and 2). The signals are applied to the analog switch (IC10, pin 10) again, and are then applied to the AF power amplifier (IC12, pin 4) via the AF volume (R226). The amplified AF signals are output from pin 10, and are then applied to the speaker which is connected with J1 via the J3.

2-1-6 RECEIVE MUTE CIRCUITS

• NOISE SQUELCH

A squelch circuit cuts out AF signals when no RF signals are received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switch.

Some noise components in the AF signals from the FM IF IC (IC1, pin 9) are applied to the D/A converter (IC8, pin 1) as "DET" signal, and are then output from pin 2. The signals are applied to the active filter section in the FM IF IC (IC1, pin 8). The active filter section filters and amplifies noise components. The amplified signals are converted into the pulse-type signals at the noise detector section and output from pin 13 as "NOIS" signal.

The "NOIS" signal from the FM IF IC is applied to the CPU (IC13, pin 53). Then the CPU analyzes the noise condition and outputs the AF mute control signal from the CPU (pin 56) as "RMUT" signal. The signal is applied to the RX mute controller (Q34) to control the AF signal muting.

• CTCSS AND DTCS

The tone squelch circuit detects tone signals and opens the squelch only when receiving a signal containing a matched subaudible tone (CTCSS or DTCS). When tone squelch is in use, and a signal with a mismatched or no subaudible tone is received, the tone squelch circuit mutes the AF signals even when noise squelch is open.

A portion of the "DET" signals from the FM IF IC (IC1, pin 9) passes through the low-pass filter (IC7, pins 10 and 8) to remove AF (voice) signals, and are then applied to the amplifier (IC7, pin 12). The amplified signals are applied to the CTCSS or DTCS decoder inside of the CPU (IC13, pin 60) as the "CDEC" signal. The CPU outputs AF mute control signal, and is then applied to the AF mute controller (Q34) and analog switch (IC10, pins 12 and 13) to control AF signals muting as "RMUT" signal.

2-2 TRANSMITTER CIRCUITS

2-2-1 MICROPHONE AMPLIFIER CIRCUIT

The microphone amplifier circuit amplifies audio signals within +6 dB/octave pre-emphasis characteristics from the microphone to a level needed for the modulation circuit.

The AF signals from the microphone are passed through the microphone mute switch (Q35), and are then applied to the amplifier (IC6, pins 9 and 8) via the high-pass filter (IC6, pins 13 and 14). The amplified signals are applied to the analog switch (IC10, pin 4), and outputs from pin 3. The signals pass through the low-pass filter (IC6, pins 6 and 7), then applied to the analog switch (IC10, pin 9) again. The signals are applied to the D/A converter (IC8, pin 4). The converted signals output from pin 3, and applied to the modulation circuit (D18) as "MOD" signal.

2-2-2 MODULATION CIRCUIT

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signals.

The AF signals from the D/A converter (IC8, pin 3) change the reactance of varactor diode (D18) to modulate the oscillated signal at the TX VCO circuit (Q13, D16, D17). The modulated VCO signal is amplified at the buffer amplifiers (Q12, Q10) and is then applied to the drive amplifier circuit via the T/R switch (D14).

The CTCSS/DTCS signals ("CENCO", "CENC1", "CENC2" from the CPU (IC13, pins 23–25) pass through the low-pass filter (IC5, pins 12 and 14) via 3 registers (R191, R192, R193) to change its wave form. Then the signals are applied to the D/A converter (IC8, pin 9). The output signals from the D/A converter (IC8, pin 10) pass through the low-pass filter (IC6, pins 6 and 7) to be mixed with "MOD" signal at the filter (IC6), and are then applied to the D/A converter again (IC8, pin 4).

2-2-3 DRIVE/POWER AMPLIFIER CIRCUITS

The drive/power amplifier circuits amplify the VCO oscillating signal to an output power level.

The modulated RF signal from the TX VCO circuit passes through the T/R switch (D14), and is amplified at the pre-drive (Q9), drive (Q8) and power (Q7) amplifiers to obtain 5 W of RF power (at 7.2 V DC).

The amplified signal passes through the power detector (D1), antenna switching circuit (D2) and low-pass filter (L1– L3, C2–C5, C175, C176), and is then applied to the antenna connector (CHASSIS unit; J1).

The bias current of the pre-drive (Q9), drive (Q8) and power (Q7) amplifiers are controlled by the APC circuit.

2-2-4 APC CIRCUIT

The APC circuit (IC2, D1) protects drive and power amplifiers from the reflected wave, and selects output power of HIGH, LOW2 or LOW1.

The power detector (D1) detects a portion of transmit power output and converts it into DC voltage. The DC voltage is at a minimum level when the antenna impedance is matched to $50\ \Omega$, and increased when mismatched.

The detected voltage is applied to the differential amplifier (IC2, pin 3), and the "T2" signal from the D/A converter (IC8, pin 23), controlled by the CPU (IC13), is applied to the other input for reference. When antenna impedance is mismatched, the detected voltage exceeds the power setting voltage. Then the output voltage of the differential amplifier (IC2, pin 4) controls the input current of the pre-drive (Q9), drive (Q8) and power (Q7) amplifiers to reduce the output power.

2-3 PLL CIRCUITS

2-3-1 PLL CIRCUIT

A PLL circuit provides stable oscillation of the transmit frequency and receive 1st LO frequency. The PLL output compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by the divided ratio (N-data) of a programmable divider.

The PLL circuit contains the TX/RX VCO circuits (TX: Q13, D16, D17; RX: Q14, D19, D20). The oscillated signal is amplified at the buffer amplifiers (Q11, Q12) and then applied to the PLL IC (IC4, pin 8) after being passed through the low-pass filter (L32, C206–C208).

The filtered signal outputs from pins 15 and 16, and is then applied to the charge pump (Q39, Q40). The signal passes through the loop filter (C146, C147, C149, R95–R97), and is then applied to the TX and RX VCO circuits as a lock voltage.

The PLL IC contains a prescaler, programmable counter, programmable divider and phase detector, etc. The entered signal is divided at the prescaler and programmable counter section by the N-data ratio from the CPU. The divided signal is detected on phase at the phase detector using the reference frequency.

If the oscillated signal drifts, its phase changes from that of the reference frequency, causing a lock voltage change to compensate for the drift in the oscillated frequency.

2-3-2 VCO CIRCUIT

The VCO circuit contains a separate RX VCO (Q14, D19, D20) and TX VCO (Q13, D16, D17). The oscillated signal is amplified at the buffer amplifiers (Q10, Q12) and is then applied to the T/R switch (D14 for TX, D15 for RX). Then the receive 1st LO (RX) signal is applied to the 1st mixer circuit (Q3) and the transmit (TX) signal to the pre-drive amplifier (Q9).

A portion of the signal from the buffer amplifier (Q12) is fed back to the PLL IC (IC4, pin 8) via the buffer amplifier (Q11) and low-pass filter (L32, C206–C208) as the comparison signal.

2-4 OTHER CIRCUITS

LED CONTROL CIRCUIT

The LED control circuit is composed of the CPU (IC13), LED driver (Q32) and LED (DS1).

The CPU outputs “RLED” and “TLED” signals from the pins 42 and 43. The signals are applied to the LED driver (Q32, pins 3 and 1). The driver outputs LED control signals to the LED (DS1).

CONDITION	COLOR
RECEIVING (2/5-TONE CODE)	ORANGE (Lighting)
LOW BATTERY (Nearly exhausted)	RED (Blinks Slowly)
LOW BATTERY (Almost exhausted)	RED (Blinks Fast)
CLONING	ORANGE (Blinking)
RECEIVING/SQUELCH OPEN	GREEN (Lighting)
TRANSMITTING	RED (Lighting)

2-5 POWER SUPPLY CIRCUIT

VOLTAGE LINE

LINE	DESCRIPTION
VCC	The voltage from the connected battery pack.
+5V	Common 5 V converted from the VCC line at the +5 regulator circuit (IC9). The output voltage is supplied to the D/A converter (IC8), analog SW (IC10) and so on.
S5V	Common 5 V converted from the VCC line at the S5 regulator circuit (Q23–Q25). The output voltage is supplied to the ripple filter (Q17), PLL IC (IC4), etc.
R5V	Receive 5 V converted from the S5V line at the R5 regulator circuit (Q22). The output voltage is supplied to the tripler (Q19), FM IF IC (IC1), IF amplifier (Q4), VCO switch (Q15, Q16), 1st mixer (Q3), etc.
T5V	Transmit 5 V converted from the S5V line at the T5 regulator circuit (Q21). The output voltage is supplied to the pre-drive (Q9), APC amplifier (IC2).

2-6 PORT ALLOCATION

D/A CONVERTER IC (IC8)

Pin number	Port name	Description
11	BAL	Outputs the modulation balance level control signal. The signal is applied to the buffer amplifier (IC7, pin 3).
23	T2	<ul style="list-style-type: none"> • Outputs the bandpass filter tuning signal during receive. The output signal is applied to the bandpass filters (D9, D10). • Outputs the TX power control signal during transmit. The output signal is applied to the APC amplifier (IC2, pin 1).
22	T1	Outputs the bandpass filter tuning signal. The output signal is applied to the bandpass filters (D4, D8).
14	LVA	Outputs the PLL lock voltage control signal. The output signal is applied to the buffer amplifier (IC7, pin 3).
15	REF	Outputs the reference oscillator correcting voltage. The voltage is applied to the buffer amplifier (IC7, pin 5).

SECTION 3 ADJUSTMENT PROCEDURES

3-1 PREPARATION

When adjusting IC-F14/S, the optional CS-F14 ADJ ADJUSTMENT SOFTWARE (Rev. 1.0 or later), JIG cable and OPC-478 CLONING CABLE (RS-232 type) or OPC-478U (USB type) are required.

- REQUIRED TEST EQUIPMENT -

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 7.2 V DC Current capacity : 5 A or more	Audio generator	Frequency range : 300–3000 Hz Output level : 1–500 mV
FM deviation meter	Frequency range : DC–300 MHz Measuring range : 0 to ±10 kHz	Attenuator	Power attenuation : 40 or 50 dB Capacity : 10 W or more
Frequency counter	Frequency range : 0.1–300 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	Standard signal generator (SSG)	Frequency range : 100–300 MHz Output level : 0.1 µV–32 mV (–127 to –17 dBm) (As open circuit.)
Digital multimeter	Input impedance : 10 MΩ/V DC or better	DC voltmeter	Input impedance : 50 kΩ/V DC or better
RF power meter (terminated type)	Measuring range : 1–20 W Frequency range : 100–300 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–20 V
		AC millivoltmeter	Measuring range : 10 mV–10 V

- SYSTEM REQUIREMENTS -

- Microsoft® Windows® 98/SE/ME/2000/XP
- RS232C/USB port

- BEFORE STARTING SOFTWARE ADJUSTMENT -

Clone adjustment frequencies, TX power, CTCSS frequency, DTCS code and IF bandwidth (see ADJUSTMENT CONFIGURATION on the next page) into the transceiver using with the CS-F14 CLONING SOFTWARE before starting SOFTWARE ADJUSTMENTS. Otherwise, the transceiver can not be adjusted.

CAUTION!: BACK UP the originally programmed memory data in the transceiver before programming the adjustment frequencies.

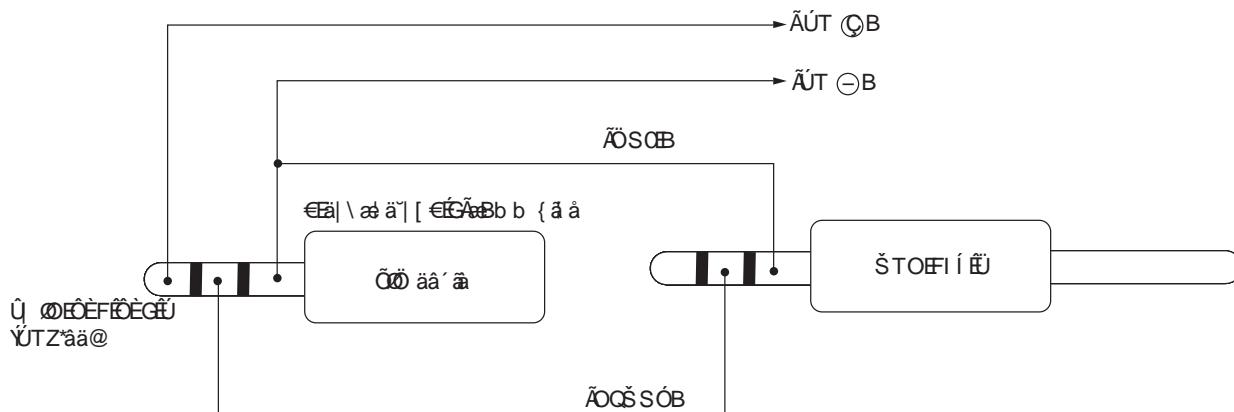

When program the adjustment frequencies into the transceiver, the transceiver's memory data will be overwritten and lose original memory data at the same time.

- STARTING SOFTWARE ADJUSTMENT -

- (1) Connect IC-F14 and PC with OPC-478/U and JIG CABLE.
- (2) Turn the transceiver power ON.
- (3) Boot up Windows, and click the program group 'CS-F14 ADJ' in the 'Programs' folder of the [Start] menu, then CS-F14 ADJ's window appears.
- (4) Click 'Connect' on the CS-F14's window, then appears IC-F14's up-to-date condition.
- (5) Set or modify adjustment data as desired.

Microsoft and Windows are registered trademarks of Microsoft Corporation in the U.S.A. and other countries.

- JIG CABLE -
